Summary

Flutter engineer with 3 years of software engineering experience shipping production mobile apps to the App Store and Google Play. Recent work includes refactoring a dating app to Riverpod and Clean Architecture, and integrating Firebase and BFF services into a sports platform at Reality Sports.

Technical Skills

Mobile & Frontend: Flutter, Clean Architecture, Riverpod, GoRouter, Provider, GetX, Unit/Widget/Integration Testing, Mockito
Core Languages: Dart, Kotlin, Swift, Java, Python, SQL, Bash, C/C++
DevOps, Cloud & Release: Firebase (Auth, Crashlytics, Remote Config), Google Play Console, TestFlight, GitHub Actions (CI/CD), Git, Docker, Docker Compose, Linux

Professional Experience

Software Engineer Sep 2025 – Present
Reality Sports *Tunis, Tunisia*

- Shipped a full-stack sports management platform to the App Store and Google Play Store, building 10+ data-driven Flutter screens and integrating 15+ RESTful backend services for real-time data synchronization.
- Spearheaded the legacy codebase refactor to Riverpod and GoRouter under Clean Architecture, eliminating critical bugs across core user flows and reducing overall app binary size by 15%.
- Integrated Firebase Crashlytics, Remote Config, and Auth as core platform features to improve crash visibility, remote configurability, and secure sign-in.
- Established a strict testing culture by writing comprehensive unit and widget tests with Mockito, achieving ∼80% code coverage.
- Architected custom Backend-for-Frontend (BFF) endpoints in Spring Boot to streamline mobile API integration, reducing integration time by 40% and unblocking parallel development cycles.

AI Engineer Intern (Graduation Project) Feb 2025 – Aug 2025
Nexaminds *Tunis, Tunisia*

- Designed a privacy-first resume parsing and candidate scoring engine using a locally hosted Mistral 7B LLM, replacing commercial third-party APIs to guarantee data confidentiality and cut operational costs.

Mobile Developer (Part-time) Oct 2022 – Feb 2025
Nexaminds (Lovester) *Tunis, Tunisia / UAE (Remote)*

- Engineered the complete Flutter frontend for the "Lovester" dating application (lovester.net), achieving fluid 60fps user interfaces and complex custom animations across 25+ unique screens.
- Led the architectural state management migration from Provider to Riverpod, improving code maintainability and accelerating onboarding for new feature development.

Mobile Engineer Intern Jul 2024 – Nov 2024
Orange Digital Center *Tunis, Tunisia*

- Built the end-to-end Flutter frontend for "Voltisense," an IoT-connected household energy monitoring application that won 2nd Place out of 20+ engineering teams in the Orange Summer Challenge.
- Engineered hardware pairing workflows and MQTT-based communication pipelines between IoT monitoring devices and the mobile app, streaming real-time energy consumption metrics to interactive graphs with sub-second latency.
- Architected the mobile application adhering to Clean Architecture principles and utilizing GetX for state management and routing.

Projects

Driver Distraction Detection System & MLOps Pipeline | *Flutter, Python, CNN, Flask, ZenML* Personal project

- Developed a Flutter mobile application connected to a Flask backend server via ngrok tunneling to deploy the model and interpret driver states in real time.
- Trained a Convolutional Neural Network (CNN) model on the Kaggle State Farm dataset to detect and classify driver distraction states in real time.

Education

National Institute of Applied Sciences and Technologies (INSAT) Sep 2020 – June 2025
National Engineering Degree in Software Engineering *Tunis, Tunisia*
